Startup Investment Analysis (Shark Tank Data)

Introduction:

This project analyzes startup investment trends using the Shark Tank dataset. The objective is to study funding distribution across industries, founder profiles, deal success rates, and equity patterns using Excel-based data analysis.

Abstract:

The Shark Tank dataset was analyzed to understand investment behavior and funding trends. Microsoft Excel was used for data cleaning, pivot table analysis, and visualization. The study identifies industry-wise funding distribution, founder gender trends, deal success patterns, and the relationship between equity offered and deal amount. The findings highlight key investment preferences and funding characteristics.

Tools Used:

- Microsoft Excel
    - Data Cleaning
    - Pivot Tables
    - Sorting and Filtering
    - Column Charts

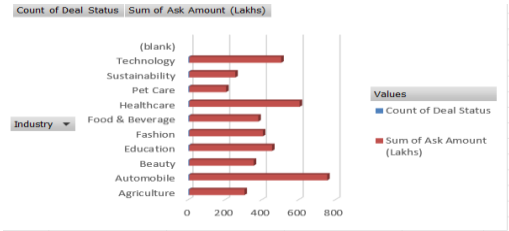
Steps Involved in Building the Project:

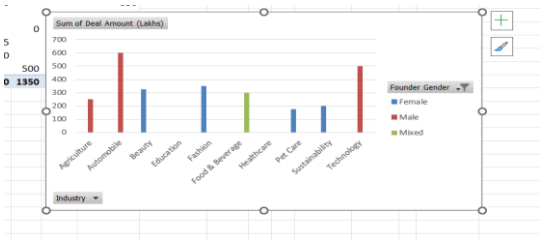
1. Collected and loaded the dataset into Excel.
2. Cleaned the data by removing duplicates and handling missing values.
3. Created Pivot Tables to analyze:
    - Industry-wise total funding

- Funding by founder gender
- Deal success rate
- Equity vs deal amount

4. Sorted data from highest to lowest to identify key trends.
5. Created charts to visually represent findings.

OUTPUT:





Conclusion:

The analysis shows that funding is concentrated in selected industries and varies based on founder composition. Deal success rates differ across sectors, and equity offered influences funding decisions. This project demonstrates how Excel can be effectively used to analyze startup investment trends and generate meaningful business insights.
